Stella Audits

WEBSITE COMPLIANCE & RISK AUDIT (POC OUTPUT)

Report ID: REDACTED-2026
Date: July 22, 2026

Target URL: `https://[REDACTED_DOMAIN]/` **Prepared By:** Stella Audits (POC Demonstration)

33/100

Overall Site Health Score: F (High Exposure)
Audit completed based on 20 total weighted findings across accessibility, SEO structure, and server security.

Executive Summary

This report summarizes an automated preliminary scan conducted against `https://[REDACTED_DOMAIN]/` across three primary risk vectors: legal exposure from accessibility gaps (ADA/WCAG), visitor loss from degraded search visibility, and server security/liability concerns.

0	7	9	4
HIGH PRIORITY	MEDIUM PRIORITY	LOW PRIORITY	INFORMATIONAL

Risk Findings by Category

- **Legal Risk (ADA / Accessibility):** 4 total findings detected.
- **Visitor Risk (SEO & Structure):** 9 total findings detected.
- **Security & Liability Risk:** 7 total findings detected.

> ***Notice:*** *This document represents a redacted proof-of-concept output. Automated scans serve as preliminary indicators and do not constitute formal legal advice, certified WCAG accreditation, or exhaustive penetration testing.*

Detailed Findings: Legal & Accessibility

Page has no top-level heading (<h1>) MEDIUM PRIORITY

Impact: Screen-reader users navigating by heading landmarks have no clear structural entry point.
Recommendation: Insert exactly one primary <h1> element reflecting the page topic.

Ref: WCAG 2.1 Success Criterion 1.3.1 (Level A)

Heading level sequence skipped LOW PRIORITY

Impact: Order jumps directly (e.g., H1 to H3), creating confusion for assistive technology outline generation.
Recommendation: Maintain strict sequential heading hierarchy throughout the document tree.

10 Duplicate ID Attributes Detected LOW PRIORITY

Impact: Identical element IDs break `aria-labelledby` targets and DOM referencing.
Sample Targets: `product_id_1019` , `product_id_1034` , `product_id_1030`

Detailed Findings: Visitor & SEO Risk

Missing Meta Description Tag MEDIUM PRIORITY

Impact: Search engines fall back to unoptimized page snippets, decreasing click-through rate.

Slow Initial Server Response Time (6,778 ms) MEDIUM PRIORITY

Impact: Initial page response exceeds acceptable benchmarks (>3,000ms), driving bounce rate high.
Recommendation: Audit host performance, database queries, and unoptimized background plugins.

Missing Structured Data (Schema.org) & XML Sitemap LOW PRIORITY

Impact: Lack of LocalBusiness schema and `sitemap.xml` limits rich snippet eligibility in search listings.

Detailed Findings: Security & Liability Risk

Missing Clickjacking Protection (X-Frame-Options) MEDIUM PRIORITY

Impact: Site can be embedded in malicious invisible frames, exposing users to UI redress attacks.
Recommendation: Emit `X-Frame-Options: SAMEORIGIN` or CSP `frame-ancestors` directive.

Server Software Version Disclosure MEDIUM PRIORITY

Disclosed Header: `server: nginx/1.29.8`
Impact: Public software versions assist automated recon tools in targeting known unpatched CVEs.

CMS / Platform Version Disclosure MEDIUM PRIORITY

Disclosed Tag: `meta generator: WordPress 7.0.2`
Recommendation: Suppress generator meta tags and restrict public header output.

Reflected Search Input Escaping Test INFORMATIONAL / PASS

Result: Single non-destructive test confirmed special characters in parameter `"s"` were safely HTML-encoded.

Remediation Road Map

Recommended Next Steps

The vulnerabilities and structural weaknesses identified in this preliminary scan are straightforward to resolve with targeted, scoped updates. Site reconstruction is not required. Implementing core security headers, adding structural H1 elements, and enabling basic local schema will resolve over 70% of identified risk points.
